

# Window Decal Application

## GREAT AMERICAN'S WINDOW DECALS:

- ★ Installs on inside of window
- ★ For best results, use soaps with no lotions/oils/or by-products that could cause streaking.

### Application Instructions:

#### STEP 1: Prepare application fluid

For best results, we recommend Wet Method Installation. Simply fill the whole spray bottle with water and add one small drop of soap. It's important to not use too much soap. Too much will result in streaks on the glass.

#### STEP 2: Clean Install Surface

Clean the area where you want to place your decal. For best results, use products that won't leave behind residue or fibers, like paper towels. Use glass cleaners or rubbing alcohol with a microfiber cloth, chamois, coffee filters, etc, if you have these options available. Allow area to fully dry.

**Clean window thoroughly with cloth and allow to fully dry.**

#### STEP 3: Determine the application area

Deciding on the placement ahead of time is especially important for larger graphics. Leave the protective cover sheet on the decal (A) while you determine exactly where you want your decal. A level and tape measure can be used to center your decal in the space, if required. Mark the location with masking tape or something similar to work use as a guide.

#### STEP 4: Spray install area

Using your spray bottle & application fluid, thoroughly wet the surface evenly where the you'll be placing the decal.

**Spray the window and the face of the decal with application fluid.**

#### STEP 5: Add decal to glass

In order to apply your decal, find the protective sheet that covers the adhesive surface. These decals go inside the glass, so the protective sheet is on the same side as the graphic. Keep the protective sheet on until you're ready to apply to the glass to avoid unnecessary marks and fingerprints.

Start by peeling the top corner/section of the decal protective sheet off and spraying the exposed decal area with the fluid. Go ahead and place onto glass surface. Don't worry if it's not 100% exact – while the decal and glass are wet it is easier to adjust and move into proper position. (For larger decals, you can add masking tape onto the back of the decal to hold in place while you gradually remove protective sheet section by section and decal is flush with the glass.)

**Once decal is in position, use squeegee to remove unwanted bubbles.**

Once the decal is fully in contact with the surface, adjust into the exact position you want and use your squeegee (B) to carefully push out the fluid and bubbles. Start from one side/the middle and work your way across.

#### STEP 6: Let it dry

Once all the excess water and air bubbles have been pushed out from under the decal, allow it to dry for 1-2 hours. If you added tape for placement, wait until the decal is fully dry before removing to ensure the decal stays in place.

### Parts Included:

- A. 1 window decal with protective cover sheet
- B. Squeegee

### Additional Items Needed:

- Window Cleaning Supplies
- 16 oz or larger Spray Bottle
- Mild dish detergent or dish soap (avoid soaps with lotions/oils/ by-products that could cause streaking.)
- Level, measuring tape or ruler (optional)
